

**Amendment to the Abstract:**

The Abstract has been amended. A revised Abstract is attached.

The invention relates to a device for receiving and releasing free forms of energy by radiation, said device comprising a number of antenna elements arranged about a common axis and respectively comprising an electrical conductor, especially an electrical conductor extending in a spiral-type manner about an axis and/or an electrical conductor consisting of interconnected closed geometrical figures. The antenna elements are divided between at least two groups provided on different parallel planes namely, a first group ~~(O1)~~ comprising at least three antenna elements ~~(10, 13)~~ that are adjacently arranged in a distributed manner, namely around at least one imaginary circle about a group axis, and a second group ~~(O2)~~. Each antenna element ~~(10, 13)~~ of the first group is electrically connected to an associated antenna element ~~(12)~~ of a second group ~~(O2)~~.

**ABSTRACT**

The invention relates to a device for receiving and releasing free forms of energy by radiation, said device comprising a number of antenna elements arranged about a common axis and respectively comprising an electrical conductor, especially an electrical conductor extending in a spiral-type manner about an axis and/or an electrical conductor consisting of interconnected closed geometrical figures. The antenna elements are divided between at least two groups provided on different parallel planes namely, a first group comprising at least three antenna elements that are adjacently arranged in a distributed manner, namely around at least one imaginary circle about a group axis, and a second group. Each antenna element of the first group is electrically connected to an associated antenna element of a second group.
